StaffSync

Modern Human Resource Management Solution

Application Screenshots with Explanation

MERN Stack: MongoDB, Express.js, React.js, Node.js

Overview of Screenshots

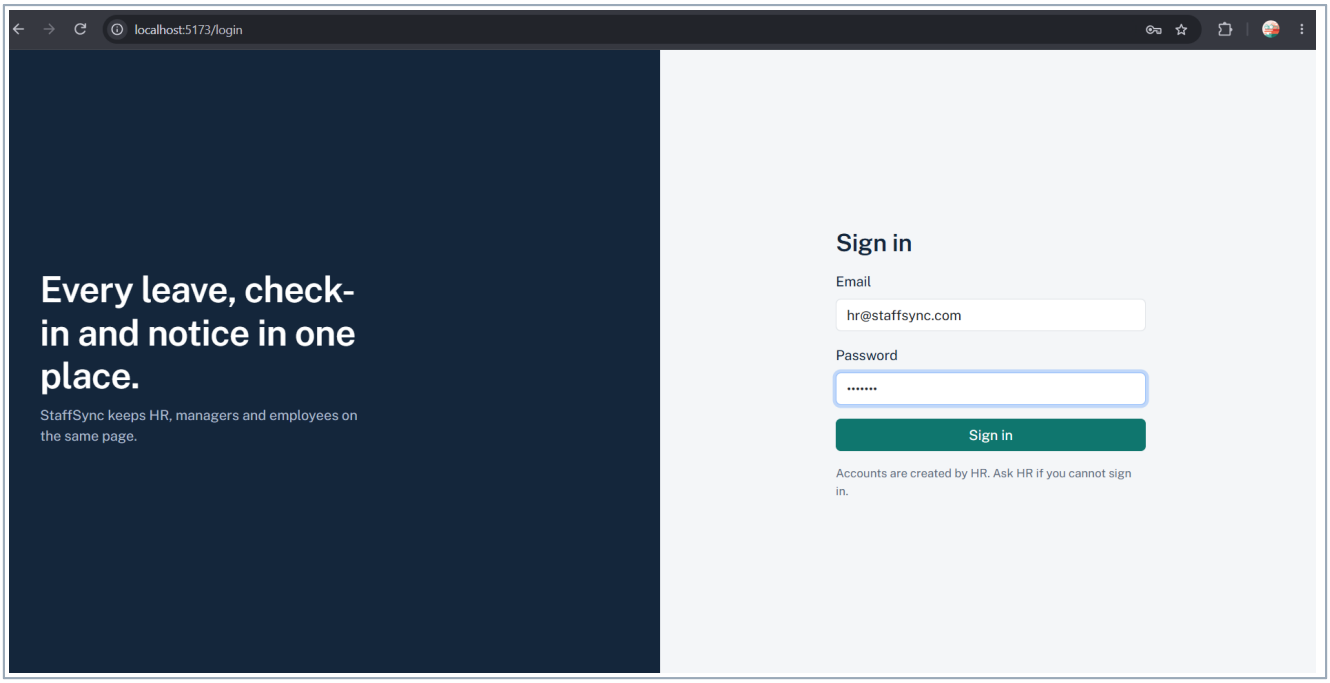

This document shows the working application of StaffSync, taken from the running system. Each page below contains one screenshot followed by its theory: the purpose of the screen, its main features, how it works technically, and which role can use it.

Figure	Screen	User role shown
1	Login Page (HR sign-in)	HR
2	HR Dashboard	HR
3	HR Profile Page	HR
4	Login Page (Employee sign-in)	Employee
5	Employee Dashboard	Employee
6	My Leave Page (Employee)	Employee
7	Login Page (Manager sign-in)	Manager
8	Manager Dashboard	Manager
9	Manager Profile Page	Manager

Technologies visible in these screenshots

- React.js with React Router for the pages and role-based routing.
- Bootstrap with custom styling for the layout, forms, cards and tables.
- Node.js and Express.js REST API on port 5000, MongoDB for storage.
- JSON Web Token (JWT) for login and bcrypt for password hashing.

Figure 1: Login Page (HR sign-in)

Login page at localhost:5173/login with the HR account entered

Purpose

The login page is the entry point of StaffSync. Every user (HR, Manager or Employee) must sign in here before any page opens. The left panel shows the product message and the right panel holds the sign-in form.

Key features

- Email and password fields; the password is shown as dots to keep it hidden.
- Sign in button with a loading state and a red alert box for wrong credentials.
- No public sign-up: the note below the form says accounts are created by HR, which keeps the system closed to outsiders.
- Responsive layout that stacks the two panels on small screens.

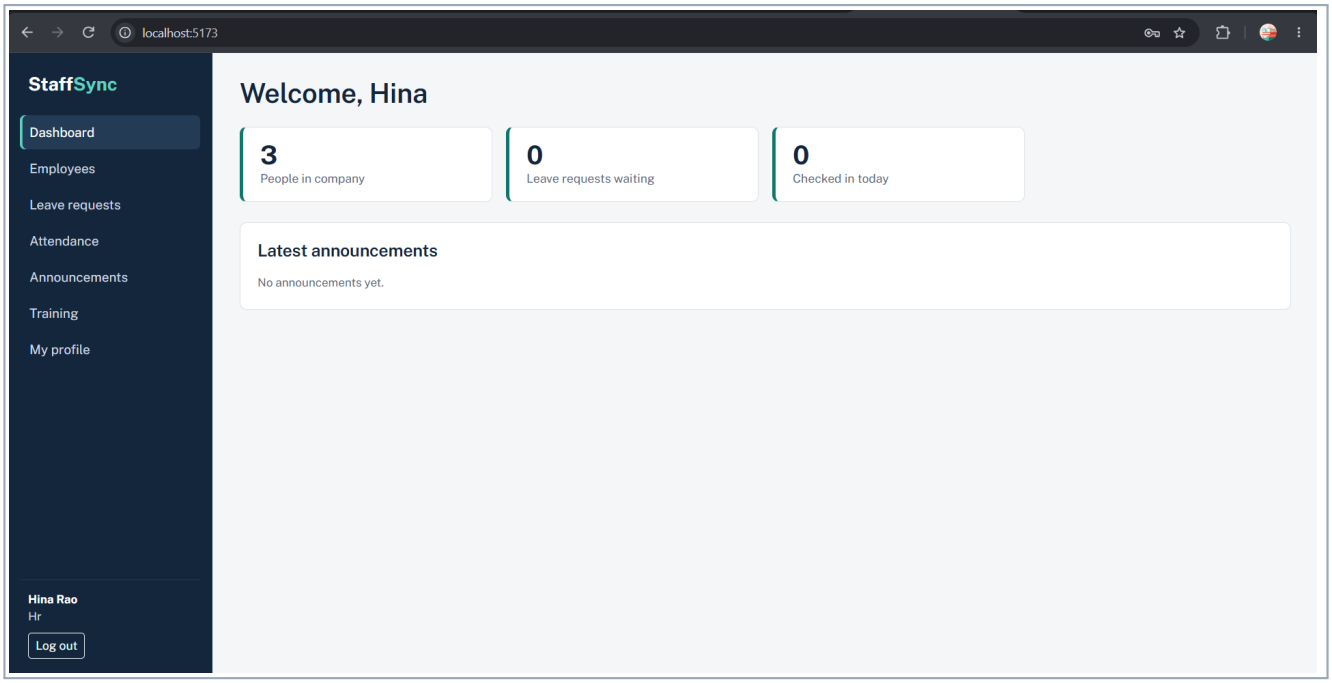

How it works

On Sign in, React sends POST /api/auth/login. The Express server finds the user by email, compares the password with the stored bcrypt hash, and returns a JWT token with the user's name and role. The token is saved in localStorage and attached to every later request as an Authorization: Bearer header.

Access

Public page. Logged-in users are redirected to the dashboard automatically.

Figure 2: HR Dashboard

HR dashboard after signing in as Hina Rao (HR)

Purpose

The dashboard is the HR home screen. It gives a quick summary of the organisation as soon as HR logs in.

Key features

- Welcome message with the logged-in user's first name.
- Three summary cards: People in company, Leave requests waiting, and Checked in today.
- Latest announcements panel showing the three most recent notices (empty state shown here).
- Sidebar with HR options: Dashboard, Employees, Leave requests, Attendance, Announcements, Training and My profile.
- User name, role and Log out button at the bottom of the sidebar.

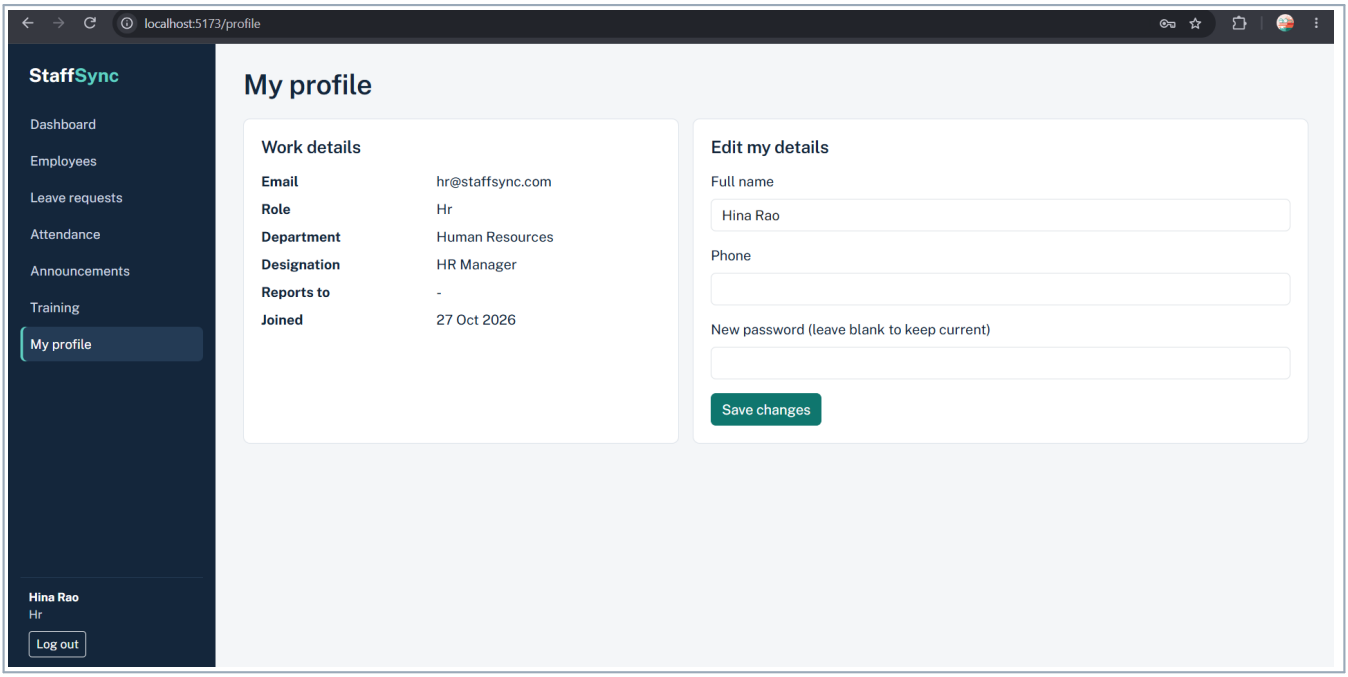

How it works

The page calls GET /api/employees, GET /api/leaves and GET /api/attendance for today's date and counts the results. Pending leaves are counted by filtering status = pending. The announcements list comes from GET /api/announcements.

Access

HR only sees the full company numbers and the Employees, Leave requests and Attendance menus.

Figure 3: HR Profile Page

My profile page of the HR user (localhost:5173/profile)

Purpose

The profile page lets a logged-in user view their official work details and update personal details such as name, phone and password.

Key features

- Work details card (read-only): email, role, department, designation, reports to and joining date.
- Edit my details card: full name, phone and an optional new password.
- Save changes button with a success or error message after saving.
- Reports to shows a dash because the HR user has no manager.

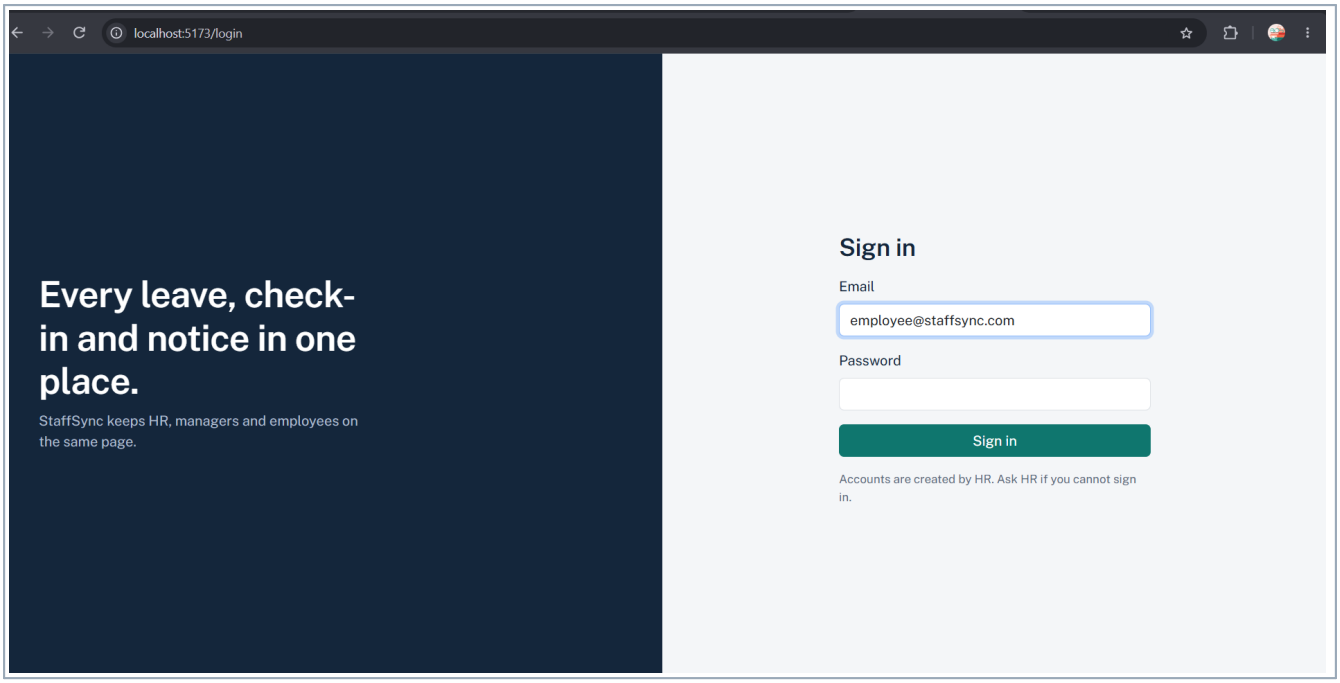

How it works

Work details load from GET /api/auth/me. Saving sends PUT /api/employees/profile with only the allowed fields (name, phone, password). A changed password is hashed again with bcrypt before it is stored. Role and department cannot be changed here, so users cannot give themselves higher access.

Access

Available to all three roles.

Figure 4: Login Page (Employee sign-in)

Login page with the Employee account email entered

Purpose

The same login page is used by every role. This screenshot shows an employee signing in; the system decides what to show based on the role returned by the server, not on which page was used.

Key features

- One common login for HR, Manager and Employee.
- Browser keeps the form simple: only email and password are required.
- Invalid details show an error message and do not open any page.

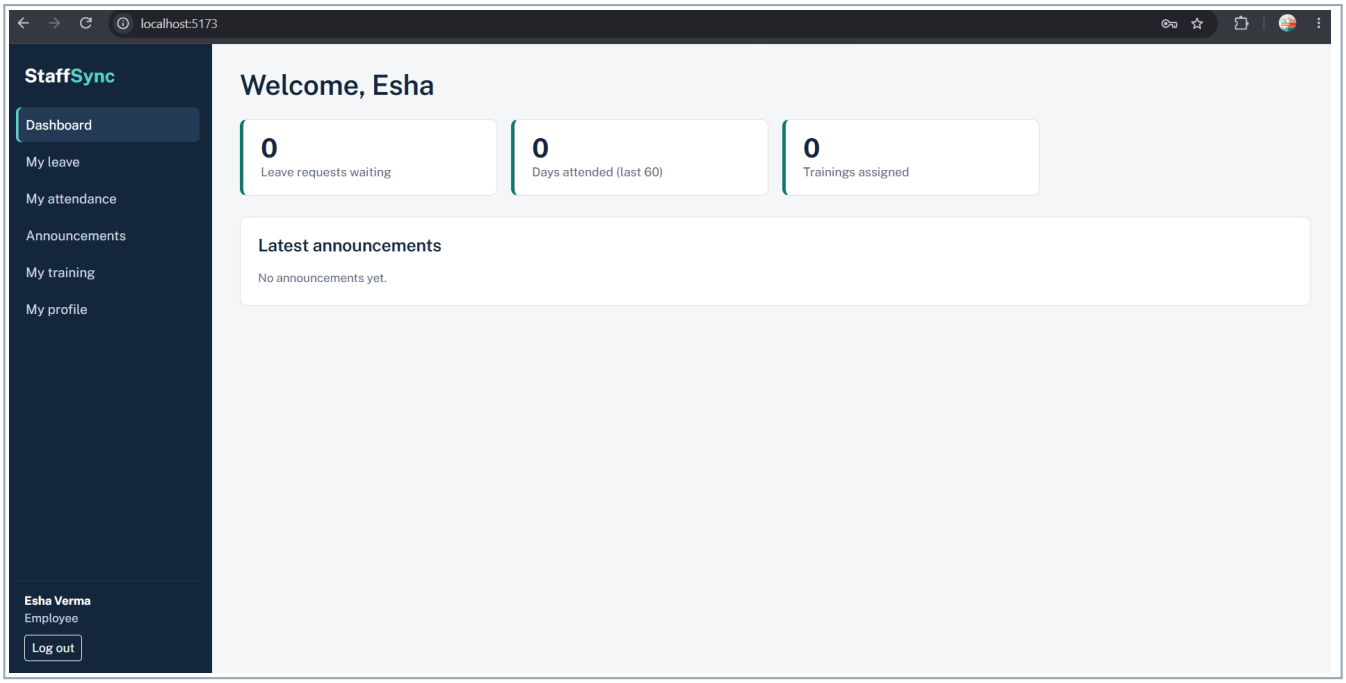

How it works

After login, the role stored in the JWT decides the menu and the allowed pages. The React ProtectedRoute component checks the role before opening any page, and the backend authorize middleware checks it again on every API request, so a user cannot reach another role's data even by typing a URL.

Access

Public page.

Figure 5: Employee Dashboard

Dashboard of Esha Verma (Employee)

Purpose

The employee dashboard shows personal information only: the employee's own leave, attendance and training summary, plus company announcements.

Key features

- Cards: Leave requests waiting, Days attended (last 60) and Trainings assigned.
- Latest announcements panel that shows notices posted by HR.
- Employee sidebar: Dashboard, My leave, My attendance, Announcements, My training and My profile.
- No Employees, Leave requests or Attendance report menu, because those are for HR and managers.

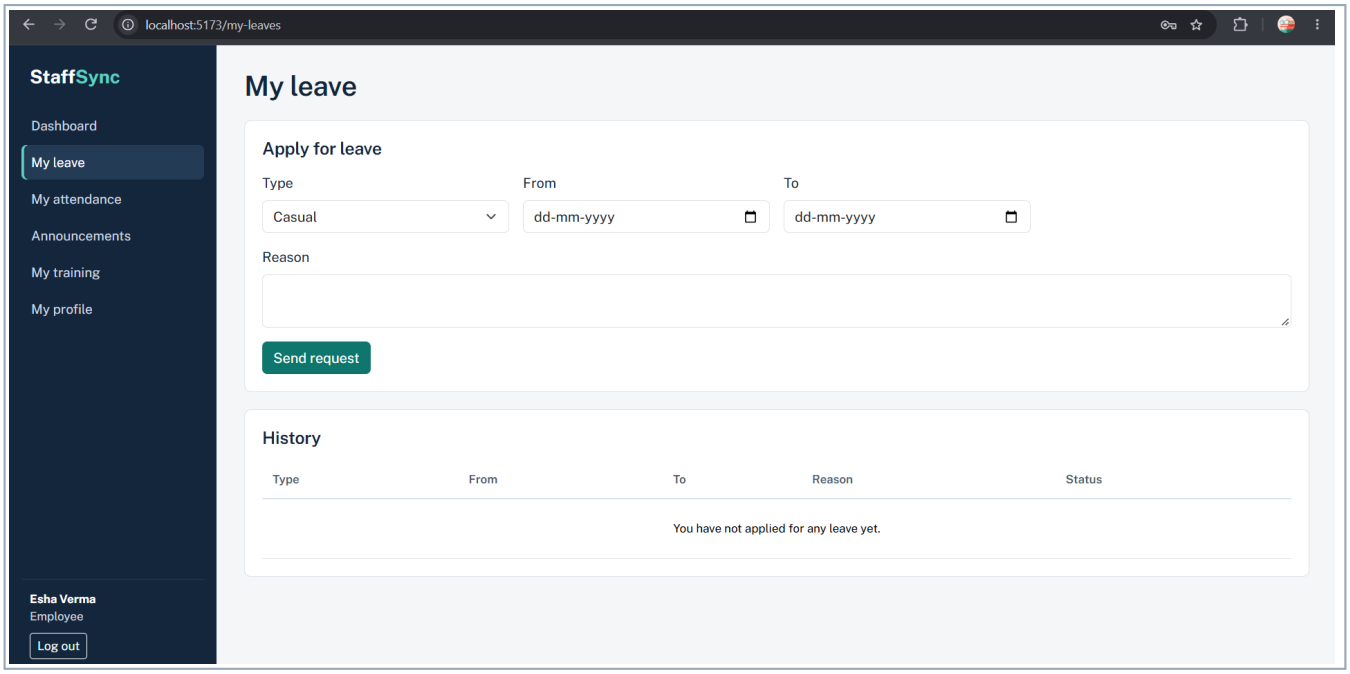

How it works

The page calls GET /api/leaves/my, GET /api/attendance/my and GET /api/trainings. The training API filters automatically so an employee only receives programs where they are a participant.

Access

Employee. The menu is shorter than HR and Manager because the role has fewer permissions.

Figure 6: My Leave Page (Employee)

Apply for leave form and leave history (localhost:5173/my-leaves)

Purpose

This page is where an employee applies for leave and tracks the status of earlier requests, replacing paper forms and verbal approvals.

Key features

- Apply for leave form with Type (Casual, Sick or Earned), From date, To date and Reason.
- Send request button; date pickers do not accept an end date before the start date.
- History table with Type, From, To, Reason and Status (pending, approved or rejected).
- Friendly empty message when no leave has been applied for yet.

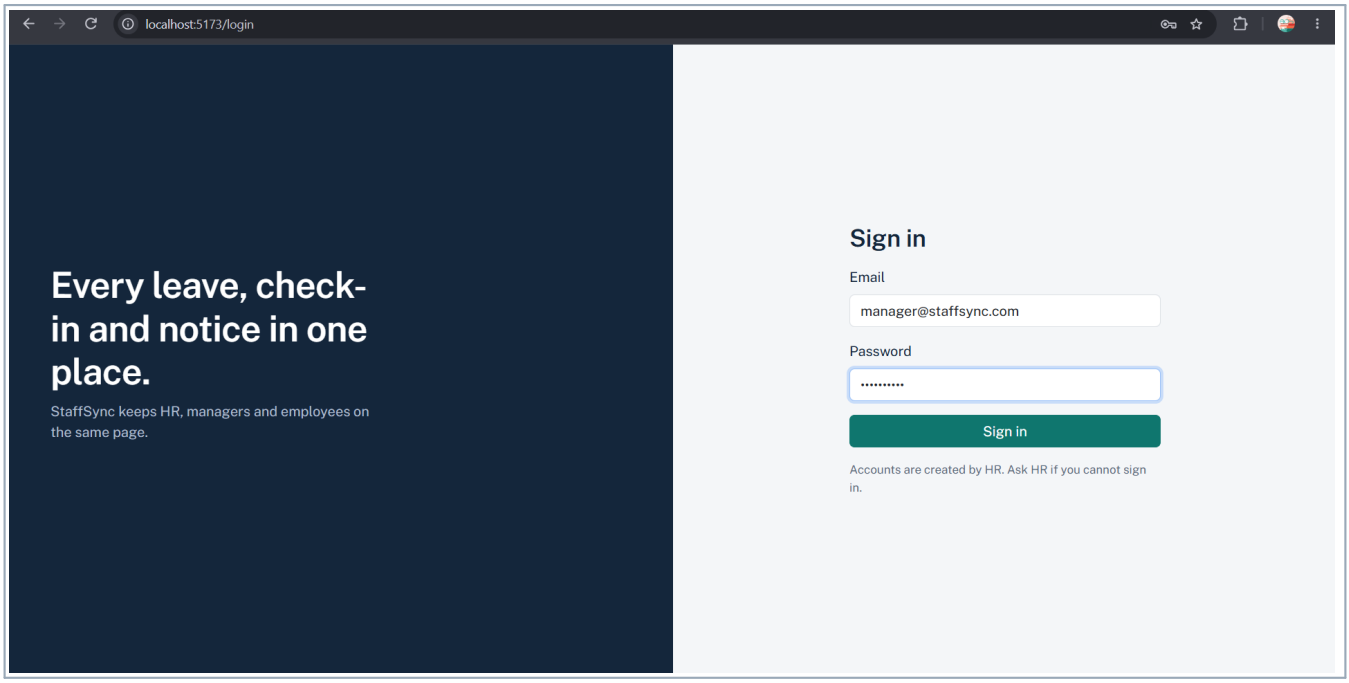

How it works

Submitting the form sends POST /api/leaves. The server validates the dates and saves the request with status pending. The manager or HR reviews it from the leave requests page, and the new status appears here in the History table after approval or rejection.

Access

Employee and Manager (managers can also apply for their own leave).

Figure 7: Login Page (Manager sign-in)

Login page with the Manager account entered

Purpose

The manager signs in through the same secure login. The screenshot shows the manager email entered and the password hidden.

Key features

- Passwords are never displayed or stored in plain text.
- Token expires after a set time (7 days in this project), so old sessions stop working.
- If the token expires or is invalid, the app clears the session and sends the user back to this page.

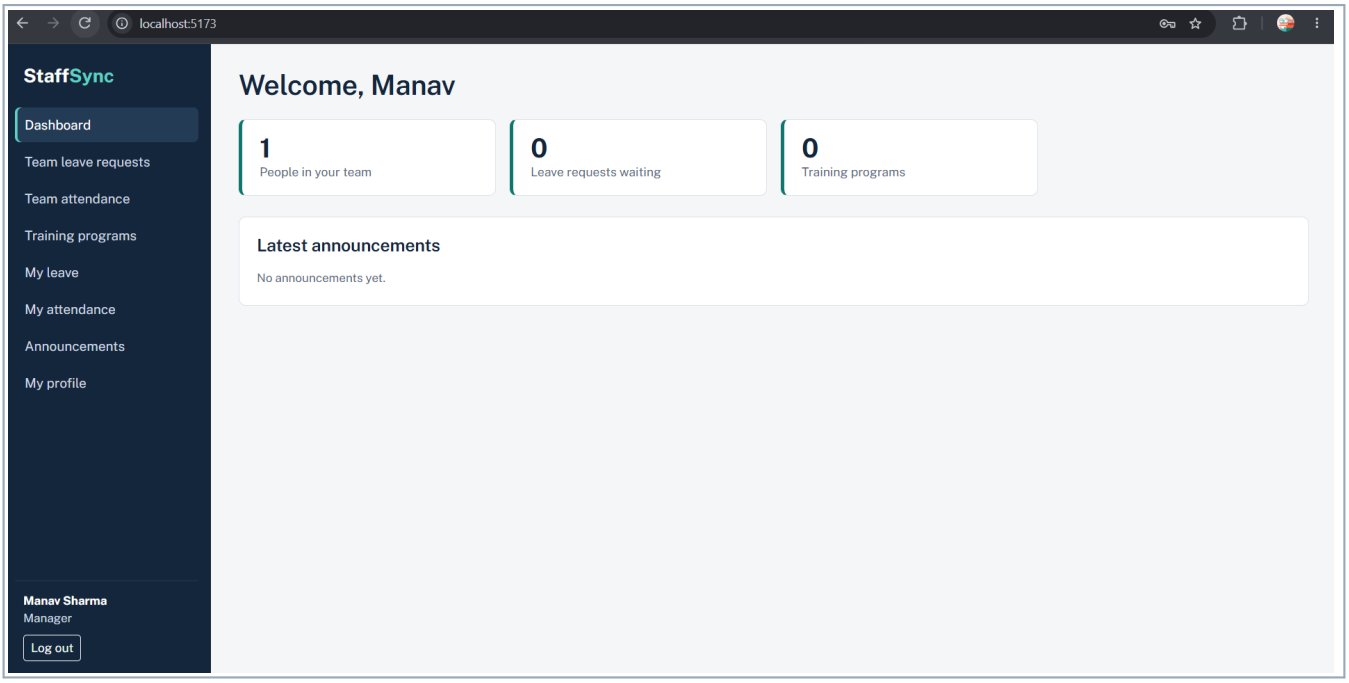

How it works

The JWT contains the user's id. On every request the protect middleware verifies the token signature with the secret key from the .env file, loads the user from MongoDB, and then the authorize middleware allows or blocks the route by role.

Access

Public page.

Figure 8: Manager Dashboard

Dashboard of Manav Sharma (Manager)

Purpose

The manager dashboard focuses on the manager's own team: its size, pending leave requests and the training programs the manager has created.

Key features

- Cards: People in your team, Leave requests waiting and Training programs.
- Sidebar: Team leave requests, Team attendance, Training programs, My leave, My attendance, Announcements and My profile.
- Latest announcements panel from HR.
- Team figures cover only employees who report to this manager.

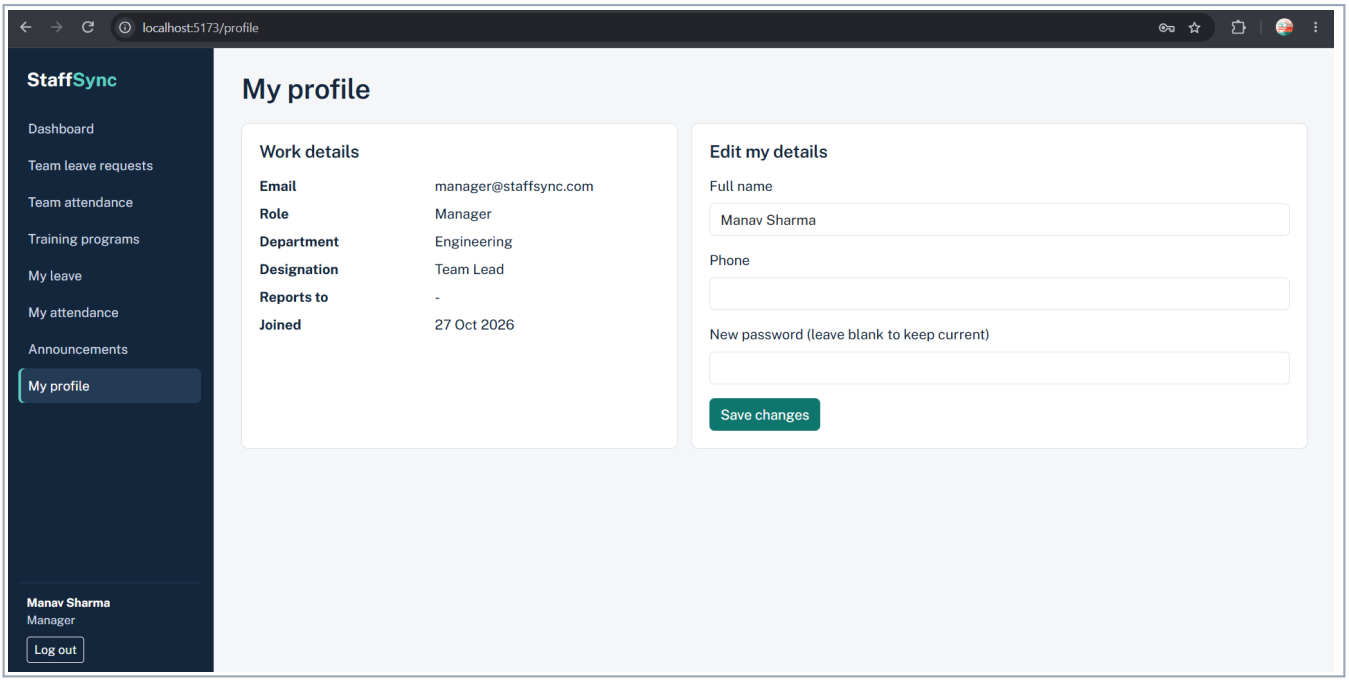

How it works

The team count comes from GET /api/employees/team, which returns users whose manager field equals the logged-in manager. Leave requests are filtered the same way, and a manager can approve or reject only requests of their own team members; any other request returns a 403 error.

Access

Manager. Combines team-management tools with the employee tools (own leave and attendance).

Figure 9: Manager Profile Page

My profile page of the Manager (localhost:5173/profile)

Purpose

The profile page shows the manager's work details and allows personal details to be updated, in the same way as for other roles.

Key features

- Work details: email, role (Manager), department (Engineering), designation (Team Lead), reports to and joining date.
- Edit my details: name, phone and new password.
- Reports to is empty because the manager is at the top of the reporting chain in this setup.

How it works

The profile uses the same GET /api/auth/me and PUT /api/employees/profile endpoints for every role. Because the route only edits the logged-in user's own record, one user can never change another user's profile.

Access

Available to all three roles.

Role-wise Summary

The screenshots show that the same application gives every role a different menu and different data. This is the role-based access control implemented with JWT.

Feature	HR	Manager	Employee
Dashboard summary	Company-wide numbers	Own team numbers	Own leave, attendance, training
Manage employees	Yes	No	No
Apply for leave	No	Yes	Yes
Approve or reject leave	All requests	Own team only	No
Attendance	View all records	Team records and own check-in	Own check-in and check-out
Announcements	Post, view, delete	View	View
Training programs	View all	Create and manage	View assigned
My profile	Yes	Yes	Yes
